//  00165 89 c2             mov edx, eax
//  00167 72 d6             jb .B5.21
                //memset(&bm_Horspool_Order2[0], cbPattern-1, 256*256); // Why why? It is 1700:1000 slower than above 'for'!?
                // The above 'memset' is translated by Intel as:
//  00127 41 b8 00 00 01
//        00                mov r8d, 65536
//  0012d 44 8b 26          mov r12d, DWORD PTR [rsi]
//  00130 e8 fc ff ff ff    call _intel_fast_memset
                // ! The problem is that 256*256, 64KB, is already too much, going bitwise i.e. 8KB is not that better, when 'cbPattern-1' is bigger than 255 - an unsigned char - then
                // we must switch to 0|1 table i.e. present or not. Since we are in 'if ( cbPattern<=NeedleThreshold2vs4swampLITE ) {' branch and NeedleThreshold2vs4swampLITE, by default, is 19 -
    it is okay to use 'memset'. !

Below segment (when compiled with Intel) is very slow, see Railgun_Trolldom two sub-columns above, compared to GCC:
*/
/*
// BMH Order 2 [
                    ulHashPattern = *(uint32_t *)(pbPattern); // First four bytes
                    for (i=0; i < 256*256; i++) {bm_Horspool_Order2[i]= (cbPattern-1);} // cbPattern-(Order-1) for Horspool; 'memset' if not optimized
                    // The above 'for' is translated by Intel as:
//.B5.21::
//  0013f 83 c0 40        add eax, 64
//  00142 66 0f 7f 44 14
//        60              movdqa XMMWORD PTR [96+rsp+rdx], xmm0
//  00148 3d 00 00 01 00  cmp eax, 65536
//  0014d 66 0f 7f 44 14
//        70              movdqa XMMWORD PTR [112+rsp+rdx], xmm0
//  00153 66 0f 7f 84 14
//        80 00 00 00     movdqa XMMWORD PTR [128+rsp+rdx], xmm0
//  0015c 66 0f 7f 84 14
//        90 00 00 00     movdqa XMMWORD PTR [144+rsp+rdx], xmm0
//  00165 89 c2           mov edx, eax
//  00167 72 d6           jb .B5.21
                    //memset(&bm_Horspool_Order2[0], cbPattern-1, 256*256); // Why why? It is 1700:1000 slower than above 'for'!?
                    // The above 'memset' is translated by Intel as:
//  00127 41 b8 00 00 01
//        00              mov r8d, 65536
//  0012d 44 8b 26        mov r12d, DWORD PTR [rsi]
//  00130 e8 fc ff ff ff  call _intel_fast_memset
                    // ! The problem is that 256*256, 64KB, is already too much, going bitwise i.e. 8KB is not that better, when 'cbPattern-1' is bigger than 255 - an unsigned char - then
                    // we must switch to 0|1 table i.e. present or not. Since we are in 'if ( cbPattern<=NeedleThreshold2vs4swampLITE ) {' branch and NeedleThreshold2vs4swampLITE, by default, is 19 -
     it is okay to use 'memset'. !
                    for (i=0; i < cbPattern-1; i++) bm_Horspool_Order2[*(unsigned short *)(pbPattern+i)]=i; // Rightmost appearance/position is needed

Below segment (when compiled with Intel) is very slow, see Railgun_Trolldom two sub-columns above, compared to GCC:
*/
/*
// BMH Order 2 [
                ulHashPattern = *(uint32_t *)(pbPattern); // First four bytes
                for (i=0; i < 256*256; i++) {bm_Horspool_Order2[i]= (cbPattern-1);} // cbPattern-(Order-1) for Horspool; 'memset' if not optimized
                // The above 'for' is translated by Intel as:
//.B5.21::
//  0013f 83 c0 40        add eax, 64
//  00142 66 0f 7f 44 14
//        60              movdqa XMMWORD PTR [96+rsp+rdx], xmm0
//  00148 3d 00 00 01 00  cmp eax, 65536
//  0014d 66 0f 7f 44 14
```

```
//       70              movdqa XMMWORD PTR [112+rsp+rdx], xmm0
//  00153 66 0f 7f 84 14
//       80 00 00 00     movdqa XMMWORD PTR [128+rsp+rdx], xmm0
//  0015c 66 0f 7f 84 14
//       90 00 00 00     movdqa XMMWORD PTR [144+rsp+rdx], xmm0
//  00165 89 c2          mov edx, eax
//  00167 72 d6          jb .B5.21
                         //memset(&bm_Horspool_Order2[0], cbPattern-1, 256*256); // Why why? It is 1700:1000 slower than above 'for'!?
                         // The above 'memset' is translated by Intel as:
//  00127 41 b8 00 00 01
//       00              mov r8d, 65536
//  0012d 44 8b 26       mov r12d, DWORD PTR [rsi]
//  00130 e8 fc ff ff ff  call _intel_fast_memset
                         // ! The problem is that 256*256, 64KB, is already too much, going bitwise i.e. 8KB is not that better, when 'cbPattern-1' is bigger than 255 - an unsigned char - then
                         // we must switch to 0|1 table i.e. present or not. Since we are in 'if ( cbPattern<=NeedleThreshold2vs4swampLITE ) {' branch and NeedleThreshold2vs4swampLITE, by default, is 19 -
        it is okay to use 'memset'. !

/*
It is possible to calculate the absolute value of a signed integer without branching:
; Example 9.15, Calculate absolute value of eax
    cdq ; Copy sign bit of eax to all bits of edx
    xor eax, edx ; Invert all bits if negative
    sub eax, edx ; Add 1 if negative
The following example finds the minimum of two unsigned numbers: if (b > a) b = a;
; Example 9.16a, Find minimum of eax and ebx (unsigned):
    sub eax, ebx ; = a-b
    sbb edx, edx ; = (b > a) ? 0xFFFFFFFF : 0
    and edx, eax ; = (b > a) ? a-b : 0
    add ebx, edx ; Result is in ebx
*/
// Sadly MS 64bit compiler accepts not the inline ASM: error C4235: nonstandard extension used : '__asm' keyword not supported on this architecture
// MASM style inline assembly, 32 bit mode
unsigned int abs_AF (int n) {
```

```
__asm {

/*
Upper and lower bounds:
The Levenshtein distance has several simple upper and lower bounds that are useful in applications which compute many of them and compare them. These include:
- It is always at least the difference of the sizes of the two strings.
- It is at most the length of the longer string.
- It is zero if and only if the strings are identical.
- If the strings are the same size, the Hamming distance is an upper bound on the Levenshtein distance.
Possible improvements to this algorithm include:
- We can adapt the algorithm to use less space, O(m) instead of O(mn), since it only requires that the previous row and current row be stored at any one time.
- If we are only interested in the distance if it is smaller than a threshold k, then it suffices to compute a diagonal stripe of width 2k+1 in the matrix. In this way, the algorithm can be run in O(kl)
        time, where l is the length of the shortest string.[1]

/*
Sadly the topic is not fully covered, so here my attempt to fill the gap follows:
noun, adjective, verb, adverb

single/singles/singlet/singlets, single/singled, single/singles/singled/singling, singly
double/doubles/doublet/doublets, double/doubled, double/doubles/doubled/doubling, doubly
triple/triples/triplet/triplets, triple/tripled, triple/triples/tripled/tripling, triply
quadruple/quadruples/quadruplet/quadruplets, quadruple/quadrupled, quadruple/quadruples/quadrupled/quadrupling, quadruply
quintuple/quintuples/quintuplet/quintuplets, quintuple/quintupled, quintuple/quintuples/quintupled/quintupling, quintuply
sextuple/sextuples/sextuplet/sextuplets, sextuple/sextupled, sextuple/sextuples/sextupled/sextupling, sextuply
septuple/septuples/septuplet/septuplets, septuple/septupled, septuple/septuples/septupled/septupling, septuply
octuple/octuples/octuplet/octuplets, octuple/octupled, octuple/octuples/octupled/octupling, octuply
nonuple/nonuples/nonuplet/nonuplets, nonuple/nonupled, nonuple/nonuples/nonupled/nonupling, nonuply
decuple/decuples/decuplet/decuplets, decuple/decupled, decuple/decuples/decupled/decupling, decuply

And one adverbial example given in HERITAGE:
triply
adv.

1. In three ways: As an actor, singer, and juggler, she was triply qualified for the role.
2. To a triple degree: a triply redundant navigational system.
3. Three times: Prices were triply inflated.

It is obvious that other analogs are in use (are preferred):
dual instead of double
quad instead of quadruple
hexa instead of sextuple

This prompts for dumping the *ad analogs (NOUNS!):
monad
duad/dyad
triad
quad/tetrad
pentad
hexad
heptad/hebdomad (for 7)
octad
ennead (for 9)
decad (for 10)
...
duodecad (for 12)
I think my choice hexadecad is even better (it refers to a group) than hexadecuple/sexdecuple couple, don't you think? (for 16)
...
chiliad (for 1000)
myriad (for 10000)
*/

// Here we'll walk through the whole length of 'm', ay-yaa.
// EXHAUSTIVE [[[[[[[[[[[[[[[[[[[[[[[[[[[[[
// Here the old fuzzy is replaced with exhaustive one, using BBs of the incoming string (here 'm').
// We need to factorize 'm' down to all 'n+AtMostLevenshteinDistance' long strings/BBs and to search into them ONE-BY-ONE - a gruelling task indeed!
//// Example:
// One of those 33/5 lines is a 46 bytes long string, i.e. m = 46:
// ¦Edelweiß ¦¦ [[edelweiss]] ¦¦ edelweiss flower
// Let's search fuzzily for "edelvais", pretending we don't know the right spelling:
// To find "edelweiss" we need at least Levenshtein distance 3, i.e. n = 8, AtMostLevenshteinDistance = 3:
// 'edelvais' vs 'edelweiss':
// - the mispelled one has one character less;
// - the mispelled one has 2 wrong characters: 'v' & 'a' instead of 'w' & 'e'.
// From above we need Building-Blocks of 46 bytes order 8+3.
// Inhere we are using order 11, 'm - Order + 1' is the number of total BBs for text 'm' bytes long: 46-11+1 = 36
// The 36 BBs:
// ¦Edelweiß ¦
// Edelweiß ¦¦
// ...
// weiss flowe
// eiss flower
//
// Not so trivial, below, when the pattern is one more or one less char the dump fails to match the proper LD:
// Kazahana 2e "Meescha Tate" kazahana3.txt 1536
// Kazahana: Total/Checked/Dumped xgrams: 3/93/0
//
// Kazahana 3e "Meescha Tate" kazahana3.txt 1536
// Kazahana: Total/Checked/Dumped xgrams: 3/34/3
// type Kazahana.txt
// *  1977  &amp;ndash; [[Ameesha Patel]], Indian actress and producer
// * [[Ameesha Patel]]

// Here we'll walk through the whole length of 'm', ay-yaa.
// EXHAUSTIVE [[[[[[[[[[[[[[[[[[[[[[[[[[[[[[
// Here the old fuzzy is replaced with exhaustive one, using BBs of the incoming string (here 'm').
// We need to factorize 'm' down to all 'n+AtMostLevenshteinDistance' long strings/BBs and to search into them ONE-BY-ONE - a gruelling task indeed!
//// Example:
// One of those 33/5 lines is a 46 bytes long string, i.e. m = 46:
// |Edelweiß || [[edelweiss]] || edelweiss flower
// Let's search fuzzily for "edelvais", pretending we don't know the right spelling:
// To find "edelweiss" we need at least Levenshtein distance 3, i.e. n = 8, AtMostLevenshteinDistance = 3:
// 'edelvais' vs 'edelweiss':
// - the mispelled one has one character less;
// - the mispelled one has 2 wrong characters: 'v' & 'a' instead of 'w' & 'e'.
// From above we need Building-Blocks of 46 bytes order 8+3.
// Inhere we are using order 11, 'm - Order + 1' is the number of total BBs for text 'm' bytes long: 46-11+1 = 36
// The 36 BBs:
// |Edelweiß |
// Edelweiß ||
// ...
// weiss flowe
// eiss flower

// EXHAUSTIVE [[[[[[[[[[[[[[[[[[[[[[[[[[[[[[
// Here the old fuzzy is replaced with exhaustive one, using BBs of the incoming string (here 'm').
// We need to factorize 'm' down to all 'n+AtMostLevenshteinDistance' long strings/BBs and to search into them ONE-BY-ONE - a gruelling task indeed!
//// Example:
// One of those 33/5 lines is a 46 bytes long string, i.e. m = 46:
// ¦Edelweiß ¦¦ [[edelweiss]] ¦¦ edelweiss flower
// Let's search fuzzily for "edelvais", pretending we don't know the right spelling:
// To find "edelweiss" we need at least Levenshtein distance 3, i.e. n = 8, AtMostLevenshteinDistance = 3:
// 'edelvais' vs 'edelweiss':

// - the mispelled one has one character less;
// - the mispelled one has 2 wrong characters: 'v' & 'a' instead of 'w' & 'e'.
// From above we need Building-Blocks of 46 bytes order 8+3.
// Inhere we are using order 11, 'm - Order + 1' is the number of total BBs for text 'm' bytes long: 46-11+1 = 36
// The 36 BBs:
// ¦Edelweiß ¦
// Edelweiß ¦¦
// ...
// weiss flowe
// eiss flower

// Here we'll walk through the whole length of 'm', ay-yaa.
// EXHAUSTIVE [[[[[[[[[[[[[[[[[[[[[[[[[[[[[
// Here the old fuzzy is replaced with exhaustive one, using BBs of the incoming string (here 'm').
// We need to factorize 'm' down to all 'n+AtMostLevenshteinDistance' long strings/BBs and to search into them ONE-BY-ONE - a gruelling task indeed!
//// Example:
// One of those 33/5 lines is a 46 bytes long string, i.e. m = 46:
// ¦Edelweiß ¦¦ [[edelweiss]] ¦¦ edelweiss flower
// Let's search fuzzily for "edelvais", pretending we don't know the right spelling:
// To find "edelweiss" we need at least Levenshtein distance 3, i.e. n = 8, AtMostLevenshteinDistance = 3:
// 'edelvais' vs 'edelweiss':
// - the mispelled one has one character less;
// - the mispelled one has 2 wrong characters: 'v' & 'a' instead of 'w' & 'e'.
// From above we need Building-Blocks of 46 bytes order 8+3.
// Inhere we are using order 11, 'm - Order + 1' is the number of total BBs for text 'm' bytes long: 46-11+1 = 36
// The 36 BBs:
// ¦Edelweiß ¦
// Edelweiß ¦¦
// ...
// weiss flowe
// eiss flower

// Here we'll walk through the whole length of 'm', ay-yaa.
// EXHAUSTIVE [[[[[[[[[[[[[[[[[[[[[[[[[[[[[[
// Here the old fuzzy is replaced with exhaustive one, using BBs of the incoming string (here 'm').
// We need to factorize 'm' down to all 'n+AtMostLevenshteinDistance' long strings/BBs and to search into them ONE-BY-ONE - a gruelling task indeed!
//// Example:
// One of those 33/5 lines is a 46 bytes long string, i.e. m = 46:
// ¦Edelweiß ¦¦ [[edelweiss]] ¦¦ edelweiss flower
// Let's search fuzzily for "edelvais", pretending we don't know the right spelling:
// To find "edelweiss" we need at least Levenshtein distance 3, i.e. n = 8, AtMostLevenshteinDistance = 3:
// 'edelvais' vs 'edelweiss':
// - the mispelled one has one character less;
// - the mispelled one has 2 wrong characters: 'v' & 'a' instead of 'w' & 'e'.
// From above we need Building-Blocks of 46 bytes order 8+3.
// Inhere we are using order 11, 'm - Order + 1' is the number of total BBs for text 'm' bytes long: 46-11+1 = 36
// The 36 BBs:
// ¦Edelweiß ¦
// Edelweiß ¦¦
// ...
// weiss flowe
// eiss flower

m = wrdlen; // strlen(wrd);
//if (m>MaxLineLength)
//{ printf( "\nKazahana: Incoming xgram exceeding the limit.\n" ); exit( 2 ); }
// Above two commented lines are too severe, changed with next line allowing to search into lines bigger than our needs:
if (m) {
if (EXHAUSTIVE_flag == 1) {

// Here we'll walk through the whole length of 'm', ay-yaa.
// EXHAUSTIVE [[[[[[[[[[[[[[[[[[[[[[[[[[[[[
// Here the old fuzzy is replaced with exhaustive one, using BBs of the incoming string (here 'm').
// We need to factorize 'm' down to all 'n+AtMostLevenshteinDistance' long strings/BBs and to search into them ONE-BY-ONE - a gruelling task indeed!
//// Example:
// One of those 33/5 lines is a 46 bytes long string, i.e. m = 46:
// ¦Edelweiß ¦¦ [[edelweiss]] ¦¦ edelweiss flower
// Let's search fuzzily for "edelvais", pretending we don't know the right spelling:
// To find "edelweiss" we need at least Levenshtein distance 3, i.e. n = 8, AtMostLevenshteinDistance = 3:
// 'edelvais' vs 'edelweiss':
// - the mispelled one has one character less;
// - the mispelled one has 2 wrong characters: 'v' & 'a' instead of 'w' & 'e'.
// From above we need Building-Blocks of 46 bytes order 8+3.
// Inhere we are using order 11, 'm - Order + 1' is the number of total BBs for text 'm' bytes long: 46-11+1 = 36
// The 36 BBs:
// ¦Edelweiß ¦
// Edelweiß ¦¦
// ...
// weiss flowe
// eiss flower

// Here we'll walk through the whole length of 'm', ay-yaa.
// EXHAUSTIVE [[[[[[[[[[[[[[[[[[[[[[[[[[[[[[
// Here the old fuzzy is replaced with exhaustive one, using BBs of the incoming string (here 'm').
// We need to factorize 'm' down to all 'n+AtMostLevenshteinDistance' long strings/BBs and to search into them ONE-BY-ONE - a gruelling task indeed!
//// Example:
// One of those 33/5 lines is a 46 bytes long string, i.e. m = 46:
// ¦Edelweiß ¦¦ [[edelweiss]] ¦¦ edelweiss flower
// Let's search fuzzily for "edelvais", pretending we don't know the right spelling:
// To find "edelweiss" we need at least Levenshtein distance 3, i.e. n = 8, AtMostLevenshteinDistance = 3:
// 'edelvais' vs 'edelweiss':
// - the mispelled one has one character less;
// - the mispelled one has 2 wrong characters: 'v' & 'a' instead of 'w' & 'e'.
// From above we need Building-Blocks of 46 bytes order 8+3.
// Inhere we are using order 11, 'm - Order + 1' is the number of total BBs for text 'm' bytes long: 46-11+1 = 36
// The 36 BBs:
// ¦Edelweiß ¦
// Edelweiß ¦¦
// ...
// weiss flowe
// eiss flower

// Above two commented lines are too severe, changed with next line allowing to search into lines bigger than our needs:
if (m) {
if (EXHAUSTIVE_flag == 1) {

// Here we'll walk through the whole length of 'm', ay-yaa.
// EXHAUSTIVE [[[[[[[[[[[[[[[[[[[[[[[[[[[[[[
// Here the old fuzzy is replaced with exhaustive one, using BBs of the incoming string (here 'm').
// We need to factorize 'm' down to all 'n+AtMostLevenshteinDistance' long strings/BBs and to search into them ONE-BY-ONE - a gruelling task indeed!
//// Example:
// One of those 33/5 lines is a 46 bytes long string, i.e. m = 46:
// ¦Edelweiß ¦¦ [[edelweiss]] ¦¦ edelweiss flower
// Let's search fuzzily for "edelvais", pretending we don't know the right spelling:
// To find "edelweiss" we need at least Levenshtein distance 3, i.e. n = 8, AtMostLevenshteinDistance = 3:
// 'edelvais' vs 'edelweiss':
// - the mispelled one has one character less;
// - the mispelled one has 2 wrong characters: 'v' & 'a' instead of 'w' & 'e'.
// From above we need Building-Blocks of 46 bytes order 8+3.
// Inhere we are using order 11, 'm - Order + 1' is the number of total BBs for text 'm' bytes long: 46-11+1 = 36
// The 36 BBs:
// ¦Edelweiß ¦
// Edelweiß ¦¦
// ...
// weiss flowe
// eiss flower

// Here we'll walk through the whole length of 'm', ay-yaa.
// EXHAUSTIVE [[[[[[[[[[[[[[[[[[[[[[[[[[[[[[
// Here the old fuzzy is replaced with exhaustive one, using BBs of the incoming string (here 'm').
// We need to factorize 'm' down to all 'n+AtMostLevenshteinDistance' long strings/BBs and to search into them ONE-BY-ONE - a gruelling task indeed!
//// Example:
// One of those 33/5 lines is a 46 bytes long string, i.e. m = 46:
// |Edelweiß || [[edelweiss]] || edelweiss flower
// Let's search fuzzily for "edelvais", pretending we don't know the right spelling:
// To find "edelweiss" we need at least Levenshtein distance 3, i.e. n = 8, AtMostLevenshteinDistance = 3:
// 'edelvais' vs 'edelweiss':
// - the mispelled one has one character less;
// - the mispelled one has 2 wrong characters: 'v' & 'a' instead of 'w' & 'e'.
// From above we need Building-Blocks of 46 bytes order 8+3.
// Inhere we are using order 11, 'm - Order + 1' is the number of total BBs for text 'm' bytes long: 46-11+1 = 36
// The 36 BBs:
// |Edelweiß |
// Edelweiß ||
// ...
// weiss flowe
// eiss flower

// Slow! [<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<

// EXHAUSTIVE [[[[[[[[[[[[[[[[[[[[[[[[[[[[[[
// Here the old fuzzy is replaced with exhaustive one, using BBs of the incoming string (here 'm').
// We need to factorize 'm' down to all 'n+AtMostLevenshteinDistance' long strings/BBs and to search into them ONE-BY-ONE - a gruelling task indeed!
//// Example:
// One of those 33/5 lines is a 46 bytes long string, i.e. m = 46:
// |Edelweiß || [[edelweiss]] || edelweiss flower
// Let's search fuzzily for "edelvais", pretending we don't know the right spelling:
// To find "edelweiss" we need at least Levenshtein distance 3, i.e. n = 8, AtMostLevenshteinDistance = 3:
// 'edelvais' vs 'edelweiss':
// - the mispelled one has one character less;
// - the mispelled one has 2 wrong characters: 'v' & 'a' instead of 'w' & 'e'.
// From above we need Building-Blocks of 46 bytes order 8+3.
// Inhere we are using order 11, 'm - Order + 1' is the number of total BBs for text 'm' bytes long: 46-11+1 = 36
// The 36 BBs:
// |Edelweiß |
// Edelweiß ||
// ...
// weiss flowe
// eiss flower

// Slow! [<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<

// Here we'll walk through the whole length of 'm', ay-yaa.
// EXHAUSTIVE [[[[[[[[[[[[[[[[[[[[[[[[[[[[[[
// Here the old fuzzy is replaced with exhaustive one, using BBs of the incoming string (here 'm').
// We need to factorize 'm' down to all 'n+AtMostLevenshteinDistance' long strings/BBs and to search into them ONE-BY-ONE - a gruelling task indeed!
//// Example:
// One of those 33/5 lines is a 46 bytes long string, i.e. m = 46:
// ¦Edelweiß ¦¦ [[edelweiss]] ¦¦ edelweiss flower
// Let's search fuzzily for "edelvais", pretending we don't know the right spelling:
// To find "edelweiss" we need at least Levenshtein distance 3, i.e. n = 8, AtMostLevenshteinDistance = 3:
// 'edelvais' vs 'edelweiss':
// - the mispelled one has one character less;
// - the mispelled one has 2 wrong characters: 'v' & 'a' instead of 'w' & 'e'.
// From above we need Building-Blocks of 46 bytes order 8+3.
// Inhere we are using order 11, 'm - Order + 1' is the number of total BBs for text 'm' bytes long: 46-11+1 = 36
// The 36 BBs:
// ¦Edelweiß ¦
// Edelweiß ¦¦
// ...
// weiss flowe
// eiss flower

// Here we'll walk through the whole length of 'm', ay-yaa.
// EXHAUSTIVE [[[[[[[[[[[[[[[[[[[[[[[[[[[[[[
// Here the old fuzzy is replaced with exhaustive one, using BBs of the incoming string (here 'm').
// We need to factorize 'm' down to all 'n+AtMostLevenshteinDistance' long strings/BBs and to search into them ONE-BY-ONE - a gruelling task indeed!
//// Example:
// One of those 33/5 lines is a 46 bytes long string, i.e. m = 46:
// ¦Edelweiß ¦¦ [[edelweiss]] ¦¦ edelweiss flower
// Let's search fuzzily for "edelvais", pretending we don't know the right spelling:
// To find "edelweiss" we need at least Levenshtein distance 3, i.e. n = 8, AtMostLevenshteinDistance = 3:
// 'edelvais' vs 'edelweiss':
// - the mispelled one has one character less;
// - the mispelled one has 2 wrong characters: 'v' & 'a' instead of 'w' & 'e'.
// From above we need Building-Blocks of 46 bytes order 8+3.
// Inhere we are using order 11, 'm - Order + 1' is the number of total BBs for text 'm' bytes long: 46-11+1 = 36
// The 36 BBs:
// ¦Edelweiß ¦
// Edelweiß ¦¦
// ...
// weiss flowe
// eiss flower
```

```

// Here we'll walk through the whole length of 'm', ay-yaa.
// EXHAUSTIVE [[[[[[[[[[[[[[[[[[[[[[[[[[[[[[
// Here the old fuzzy is replaced with exhaustive one, using BBs of the incoming string (here 'm').
// We need to factorize 'm' down to all 'n+AtMostLevenshteinDistance' long strings/BBs and to search into them ONE-BY-ONE - a gruelling task indeed!
//// Example:
// One of those 33/5 lines is a 46 bytes long string, i.e. m = 46:
// ¦Edelweiß ¦¦ [[edelweiss]] ¦¦ edelweiss flower
// Let's search fuzzily for "edelvais", pretending we don't know the right spelling:
// To find "edelweiss" we need at least Levenshtein distance 3, i.e. n = 8, AtMostLevenshteinDistance = 3:
// 'edelvais' vs 'edelweiss':
// - the mispelled one has one character less;
// - the mispelled one has 2 wrong characters: 'v' & 'a' instead of 'w' & 'e'.
// From above we need Building-Blocks of 46 bytes order 8+3.
// Inhere we are using order 11, 'm - Order + 1' is the number of total BBs for text 'm' bytes long: 46-11+1 = 36
// The 36 BBs:
// ¦Edelweiß ¦
// Edelweiß ¦¦
// ...
```

```
// weiss flowe

// Here we'll walk through the whole length of 'm', ay-yaa.
// EXHAUSTIVE [[[[[[[[[[[[[[[[[[[[[[[[[[[[[
// Here the old fuzzy is replaced with exhaustive one, using BBs of the incoming string (here 'm').
// We need to factorize 'm' down to all 'n+AtMostLevenshteinDistance' long strings/BBs and to search into them ONE-BY-ONE - a gruelling task indeed!
//// Example:
// One of those 33/5 lines is a 46 bytes long string, i.e. m = 46:
// ¦Edelweiß ¦¦ [[edelweiss]] ¦¦ edelweiss flower
// Let's search fuzzily for "edelvais", pretending we don't know the right spelling:
// To find "edelweiss" we need at least Levenshtein distance 3, i.e. n = 8, AtMostLevenshteinDistance = 3:
// 'edelvais' vs 'edelweiss':
// - the mispelled one has one character less;
// - the mispelled one has 2 wrong characters: 'v' & 'a' instead of 'w' & 'e'.
// From above we need Building-Blocks of 46 bytes order 8+3.
// Inhere we are using order 11, 'm - Order + 1' is the number of total BBs for text 'm' bytes long: 46-11+1 = 36
// The 36 BBs:
// ¦Edelweiß ¦
```

```
// Edelweiß !!
// ...
// weiss flowe
// eiss flower

// Here we'll walk through the whole length of 'm', ay-yaa.
// EXHAUSTIVE [[[[[[[[[[[[[[[[[[[[[[[[[[[[[
// Here the old fuzzy is replaced with exhaustive one, using BBs of the incoming string (here 'm').
// We need to factorize 'm' down to all 'n+AtMostLevenshteinDistance' long strings/BBs and to search into them ONE-BY-ONE - a gruelling task indeed!
//// Example:
// One of those 33/5 lines is a 46 bytes long string, i.e. m = 46:
// |Edelweiß || [[edelweiss]] || edelweiss flower
// Let's search fuzzily for "edelvais", pretending we don't know the right spelling:
// To find "edelweiss" we need at least Levenshtein distance 3, i.e. n = 8, AtMostLevenshteinDistance = 3:
// 'edelvais' vs 'edelweiss':
// - the mispelled one has one character less;
```

```
// - the mispelled one has 2 wrong characters: 'v' & 'a' instead of 'w' & 'e'.
// From above we need Building-Blocks of 46 bytes order 8+3.
// Inhere we are using order 11, 'm - Order + 1' is the number of total BBs for text 'm' bytes long: 46-11+1 = 36
// The 36 BBs:
// ¦Edelweiß ¦
// Edelweiß ¦¦
// ...
// weiss flowe
// eiss flower
